

AMENDMENTS TO THE CLAIMS

Please amend, cancel and add to the claims, as per the listing of claims:

Claims 1-11 (cancelled).

Claim 12 (currently amended). An optical scanning apparatus comprising:

a scanner body;

a light bar assembly supported within the scanner body, the light bar assembly comprising a drive motor, a drive wheel and a light source, the light bar assembly configured to move the drive motor and the light source together; and

~~The optical scanning apparatus of claim 11,~~ and wherein the scanner body defines an inside upper surface, and wherein the drive wheel contacts the inside upper surface of the scanner body.

Claim 13 (original). The optical scanning apparatus of claim 12, and further comprising a support surface within the scanner body, upon which the light bar assembly is supported, and wherein the light bar assembly further comprises support wheels which rest on the support surface.

Claim 14 (original). The optical scanning apparatus of claim 13, and wherein the light bar assembly further comprises biasing members which support the support wheels on the light bar assembly, and wherein the biasing members urge the support wheels against the support surface, and thereby urge the drive wheel against the drive surface.

Claim 15 (currently amended). The optical scanning apparatus of claim 12 ~~[[11]]~~, and further comprising a position detecting system to allow the detection of the position of the light bar assembly with respect to the scanner body.

(Continued on next page.)

1 Claim 16 (original). An optical scanning apparatus comprising:

2 a scanner body;

3 a magnet-track portion of a linear electric motor fixedly supported within the
4 scanner body;

5 a light bar assembly comprising a slider portion of a linear electric motor; and

6 wherein the light bar assembly is supported in the scanner body to place the
7 magnet-track portion in proximity to the slider portion to thereby allow the light bar
8 assembly to be driven along the magnet-track portion.

9 Claim 17 (original). The optical scanning apparatus of claim 16, and wherein the
10 light bar assembly is suspended from the magnet-track portion.

11 Claim 18 (original). The optical scanning apparatus of claim 16, and wherein the
12 light bar assembly rests on top of the magnet-track portion.

13 Claim 19 (original). The optical scanning apparatus of claim 16, and wherein the
14 light bar assembly rests on a support surface defined within the scanner body such
15 that the slider-portion and the magnetic-track portions are not in direct contact with
16 one another.

17 Claim 20 (original). The optical scanning apparatus of claim 16, and further
18 comprising a position detecting system to allow the detection of the position of the
19 light bar assembly with respect to the scanner body.

20 Claim 21 (original). The optical scanning apparatus of claim 20, and wherein the
21 position detecting system comprises:

22 a linear encoding strip supported within the scanner body and mounted
23 parallel to the magnet-track portion; and

24 a sensor supported by the light bar assembly and configured to detected the
25 linear encoding strip.

(Continued on next page.)

1 Claim 22 (original). The optical scanning apparatus of claim 16, and wherein:
2 the light bar assembly is defined by a first end and a second end;
3 the magnet-track portion is a first magnet-track portion, the slider portion is a
4 first slider portion, and the slider portion is supported proximate the first end of the
light bar assembly;
5 the optical scanning apparatus further comprising:
6 a second magnet-track portion supported within the scanner body; and
7 a second slider portion supported proximate the second end of the light bar
8 assembly and in contact with the second magnet track portion.

9 Claim 23 (original). A method of moving a light bar assembly within a scanner body
10 of an optical scanning apparatus comprising:
11 providing a stationary track within the scanner body;
12 providing a motive source supported by the light bar assembly; and
13 moving the light bar assembly along the stationary track using the motive
14 source.

15 Claim 24 (original). The method of claim 23, and wherein the light bar assembly is
16 moved to a plurality of positions along the stationary track, the method further
17 comprising determining the position of the light bar assembly as it is moved along
18 the stationary track.

19 Claim 25 (original). The method of claim 23, and further comprising urging the light
20 bar assembly against the stationary track while moving the light bar assembly along
21 the stationary track.

22 Claims 26-28 (canceled).

23
24 Claim 29 (previously presented). A scanner, comprising:
25 a light configured to move linearly within the scanner;
a motor in fixed association with the light source such that the light source and
the motor are moved together.

1 Claim 30 (previously presented). The scanner of claim 29, further comprising a
2 support member, the light and the motor fixedly attached to the support member, the
3 support member movable within the scanner.

4 Claim 31 (previously presented). The scanner of claim 30, wherein the motor is
5 configured to linearly move the support member within the scanner.

6
7 Claim 32 (previously presented). The scanner of claim 30, wherein the motor is
8 connected to a drive wheel via a series of meshing gears, the drive wheel contacting
9 a track within the scanner, the drive wheel carried by the support member.

10 Claim 33 (new). An optical scanning apparatus comprising:

11 a scanner body;
12 a self-propelled light bar assembly supported within the scanner body, the
13 self-propelled light bar assembly comprising a drive wheel;
14 a platen supported by the scanner body;
15 a drive track defined on the platen; and
16 wherein the drive wheel is in contact with the drive track to allow the drive
17 wheel to drive the light bar assembly along the platen.

18 Claim 34 (new). An optical scanning apparatus comprising:

19 a scanner body;
20 a self-propelled light bar assembly supported within the scanner body, the
21 self-propelled light bar assembly comprising a drive wheel;
22 a platen supported by the scanner body, the platen defining a first edge;
23 a drive track supported within the scanner body and positioned adjacent to the
24 first edge of the platen; and
25 wherein the drive wheel is in contact with the drive track to allow the drive
wheel to propel the light bar assembly with respect to the scanner body.

(Continued on next page.)

1 Claim 35 (new). An optical scanning apparatus comprising:

2 a scanner body;

3 a self-propelled light bar assembly supported within the scanner body, the
4 self-propelled light bar assembly comprising a drive wheel;

5 a drive track supported within the scanner body, the , and wherein:

6 the drive wheel is in contact with the drive track to allow the drive wheel to
7 propel the light bar assembly with respect to the scanner body; and

8 the drive wheel includes a rubberized outer portion, and the drive track has a
9 non-smooth surface to allow the rubberized outer portion of the drive wheel to
10 engage the drive track.

11 Claim 36 (new). An optical scanning apparatus comprising:

12 a scanner body;

13 a self-propelled light bar assembly supported within the scanner body; and

14 wherein the light bar assembly comprises a linear electric motor configured to
15 propel the light bar assembly.
